

Pharmacy & Hospital Management System - User Manual

Pharmacy & Hospital Management System is a complete and multi-functional hospital or medical center management system, build using ASP.NET Core.

The system can provide an automated way of managing any pharmacy & hospital activities rather than a traditional system. Moreover, this system can operate regular hospital activities like inpatient, outpatient, billing, test, bed management, account sector, etc. accurately and efficiently. Also, it helps to generate the daily, weekly, monthly, half-yearly, and yearly reports of sales, revenue, patients, lab test, bed management, etc. as your requirement easily. To see these reports, you need to click on some options.

The most important thing is that an admin can observe everyone through the software. An internal messaging platform helps employees to communicate with each other as well. All in all, clinic management software helps you to be with trends, and it also gives you the chance to run your business administration digitally and very efficiently.

Step 4:

No need to create new migration rule and update database. You just need to build and run the application. Already initial migration rule included with project. Please make sure MS SQL server running properly.

Step 5:

5.1: Build application by pressing f6

5.2: Run application by pressing f5

<https://localhost:5001/>

Initially in the SQL server, relevant tables and data will be created in the database dynamically as code first approach.

Step 6:

Browse full application.
